Gel Application Guide

Step 1:   Download the O'Pens App on your mobile device and link the kit as instructed in the box

Step 2:   Prepare the nail surface by buffing, smoothing, and cleaning the nail area (a base gel is highly recommended before gel application).

Step 3:   Set your mobile device to the brightest screen setting before choosing a colour and applying (some screens differ and the colour may come out slightly different than to what you see on your phone)

Step 4:   Choose the colour inside the O'Pens App and the number of nails to be painted (toenails usually only need 5 nails chosen on the O'Pens App)

Step 5:   Follow the measurement instructions by matching from those in the App to those on the pen itself.

Step 6:   Push the air out of the pen (2-3 squeezes) before starting to mix

Step 7:   Mix the colors thoroughly on the mixing pallets

Step 8:   Apply the colour evenly onto the nail surface (2-3 coats is recommended for best results) and cure for 60+ seconds.

Step 9:   Apply top seal gel and cure under LED light for 60+ seconds.

<u>Important Notes</u>

- Remember to take off the small black lids on the pen nozzles
- Can be used on natural nails, tips, acrylic, builder gel, rubber base gel, or press-on nails
- Keep bottles standing upwards when not in use
- Remember to 'exhaust' the air out of the pen first
- Hold the pen vertically (straight up) when squeezing drops of gel onto the mixing pallets
- Clean the mixing brush and mixing pallets gently with a tissue or cotton wool and a good quality brush cleaning solution
- Two or more gel coats is recommended
- Remove gel on the nails by filing the gel color off or your own soaking technique
- If you find that the pen is not pressing gel out, turn the measurement to the number 5 and press a few more times – it will not always come out on the lower settings (0.5 or 1) in the beginning.
